Projects

- **TWITTER SENTIMENT ANALYSIS USING PYTHON**
  Twitter sentiment analysis using a hybrid model of LSTM, CNN, and Glove is a popular approach for analyzing the sentiment of Twitter data. The main goal of this approach is to classify tweets as positive, negative, or neutral based on the sentiment expressed in the text. The hybrid model combines the strengths of different deep learning techniques to achieve high accuracy and performance in sentiment analysis tasks.
  1. The LSTM layer of the model is used to capture the sequence of the text data and learn the long-termdependencies and context.
  2. The CNN layer is used to extract local patterns and features from different parts of the text.
  3. The Glove embeddings are used to capture the semantic meaning of words and handle out-of-vocabularywords
